

# Analysing forest owners' attitudes to different types of risk

François Didolot

Olivier Picard

Bilbao – September 9<sup>th</sup> 2014

# Plan of the presentation

- General context
- A survey
- Some results
- Some recommendations

# General context

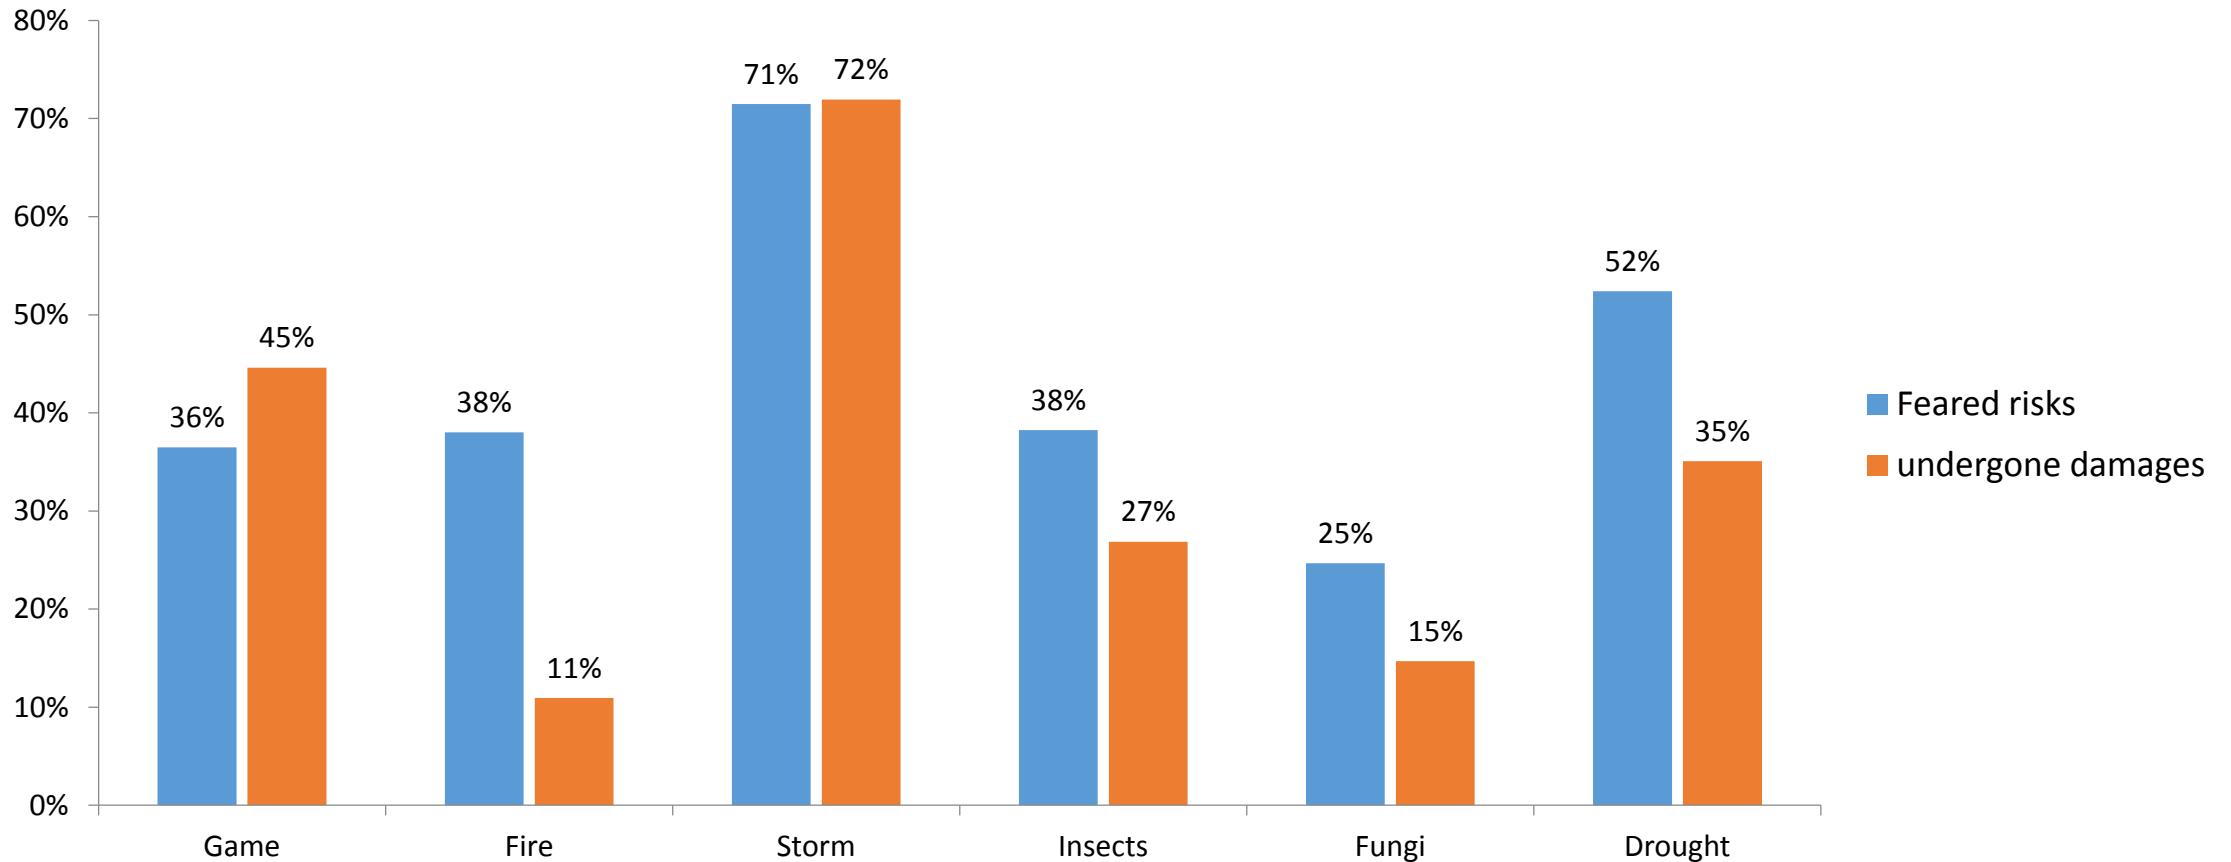

- A major storm (1999)
  - Fear of climate change
  - Game
- 
- Two national surveys about the behaviour of private forest owners
  - But the question of the risk is not further explored
  - A specific survey was needed and was carried out
  - The results were compared to other surveys

Survey area

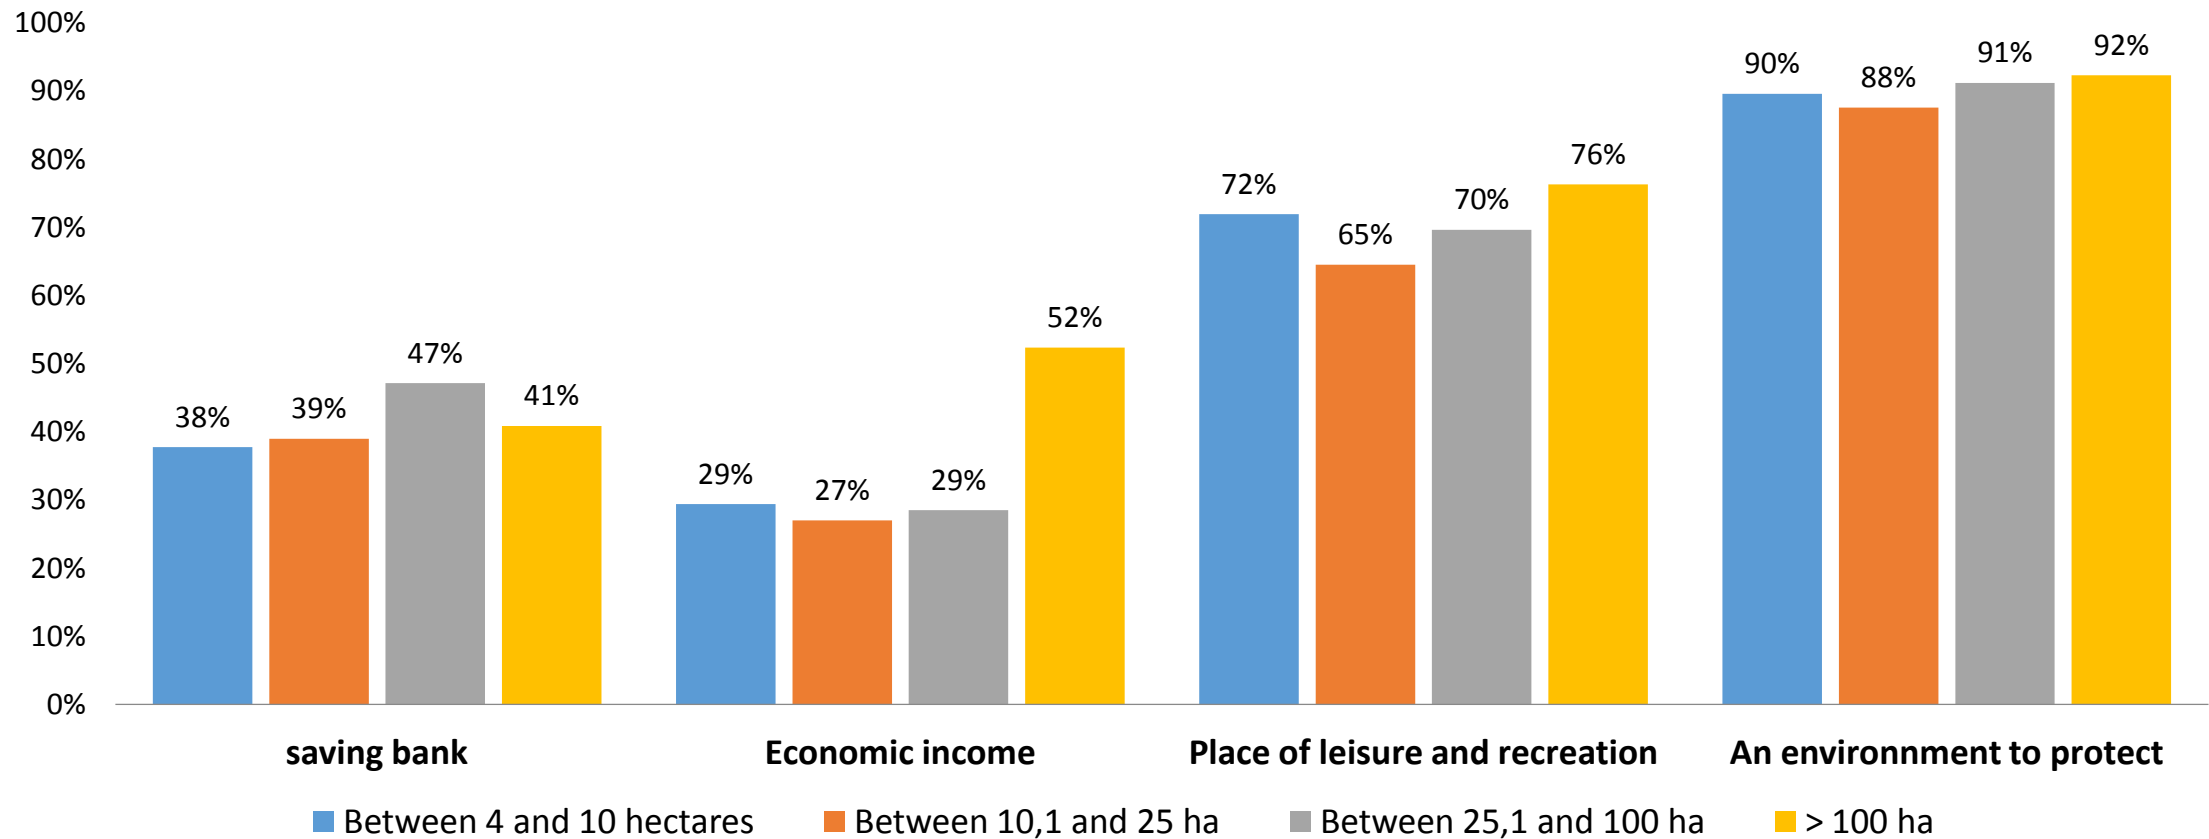

# Some results

Comparison of feared risks with damages undergone

# Some results

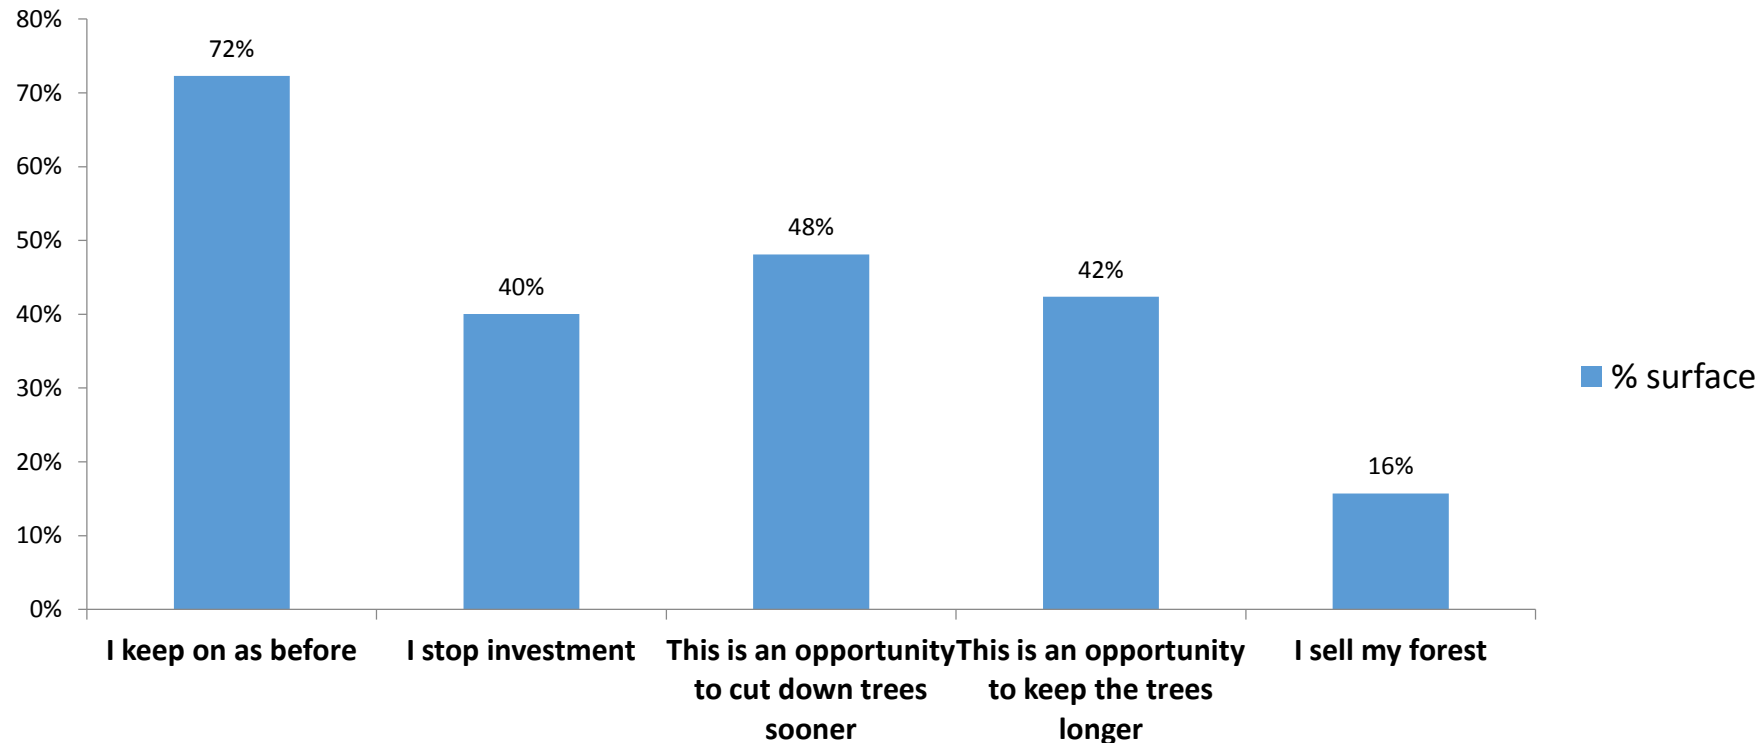

## Perceptions of the forest

# Some results

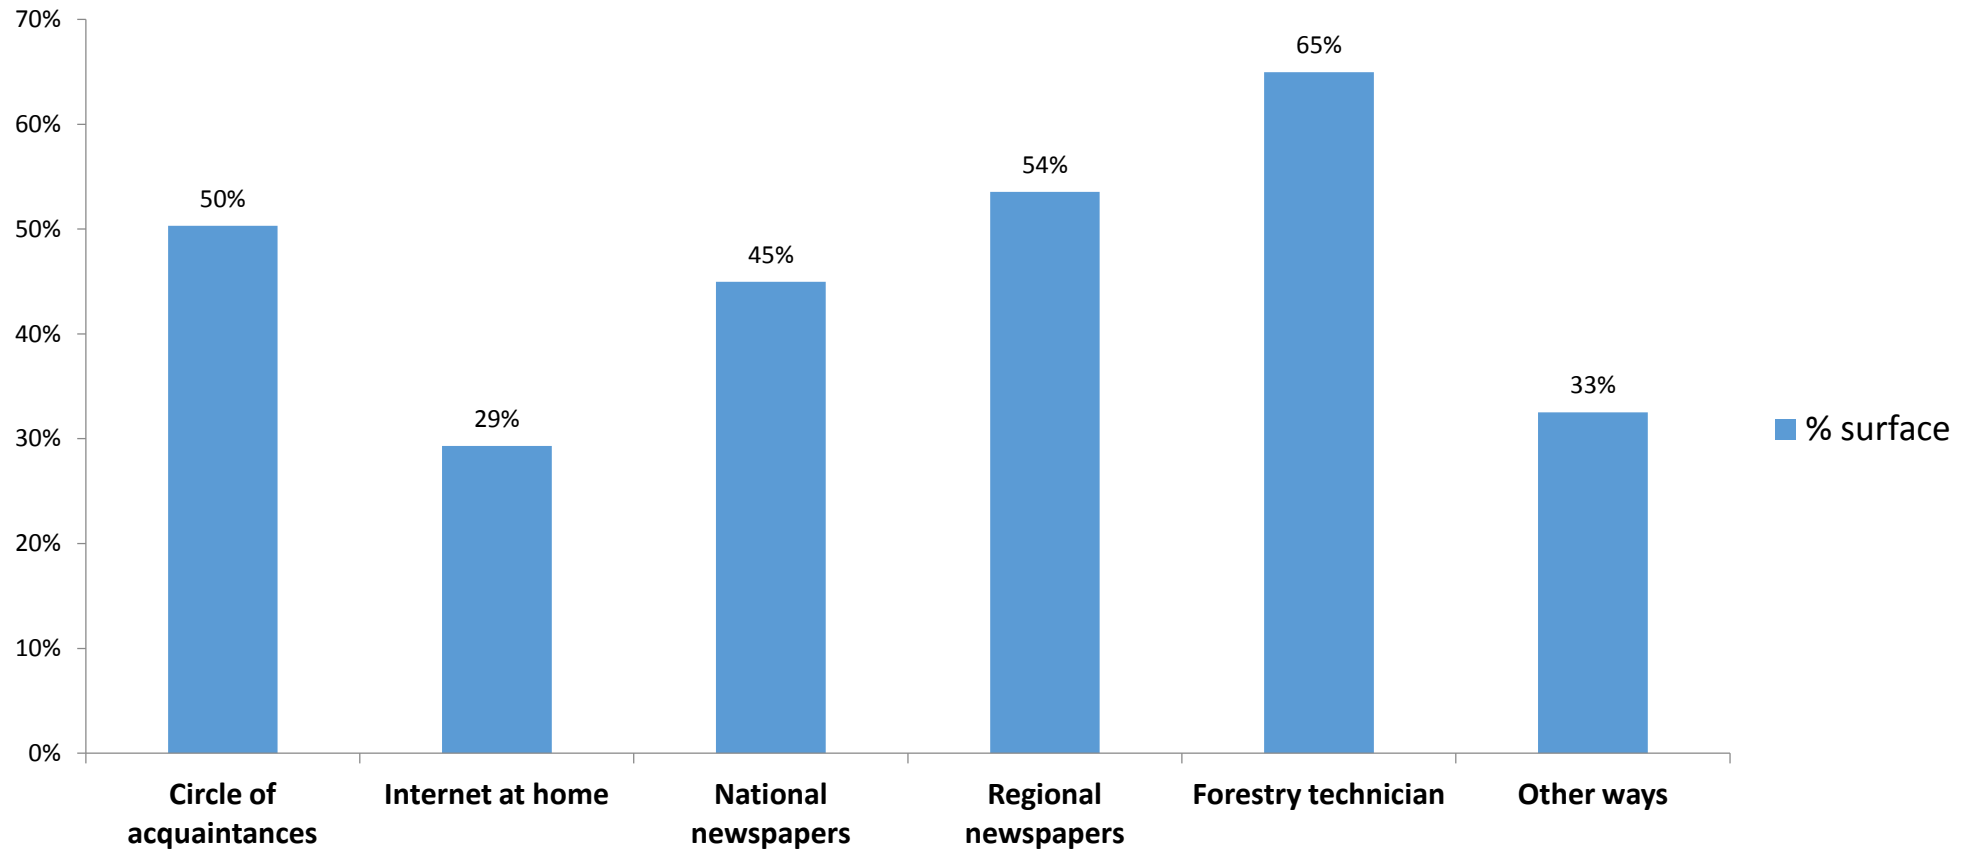

- If your wood is affected by damage will you do?

**% Area by type of management**

# Some results

## % area by type information search

# Some recommendations

- Move away from the dictatorship of the "information leaflet", use multi-channels to inform.
- Offer information media that can be used in forests.
- No unique answer with multiple risks in different situations.
- The emergence of the climatic risk pushes aside the traditional solutions, it is necessary to innovate.
- Risk management and their consideration in the management require technical answers, but also societal answers and innovation in terms of professional organisation and information sharing.
- Insurance does not appear to be the solution to tackle risks.

# Analysing forest owners' attitudes to different types of risk

Thank you for your attention
